The value of the attribute "content portion" consists of a sequence of numbers, each of which indicates a content portion of that object. Each of these numbers is equal to the last number in the content portion identifier.

which uniquely identifies a particular page. The delimiter between "1" and this second number is the "space" character.

Example:

"1 27" corresponding coding: w'31 20 32 37w'H

The subordinate block identifiers are composed of the identifier of the page to which they belong extended with an additional number which uniquely identifies a particular block. The delimiter between the prefix derived from the page identifier and this additional number is the "space" character.

Example:

"1 27 5" corresponding coding: w'31 20 32 37 20 35w'H

The generic structure of a document for mixed mode of operation is composed of a set of object class descriptions, some of them being structured.

The first number of the object class identifier is always "0". The other number may be allocated as mentioned above for specific object identifiers for object class descriptions which are internally structured.

Example: page class description composed of blocks, etc....

For independent object class descriptions, a second number is added to "0" with a

"space" character as a delimiter.

Examples:
a) page class description with two block class descriptions
   page class description "0 5" coding: w'30 20 35w'H
   first block class description "0 5 0" coding: w'30 20 35 20 30w'H
   second block class description "0 5 1" coding: w'30 20 35 20 31w'H
b) independent block class description
   block class description "0 25" coding: w'30 20 32 35w'H

For both generic and specific structures, content portion identifiers are composed of the identifier of the object/object class to which the content portion belongs and an additional number which uniquely identifies a particular content portion.
Examples:

block description "1 27 5" coding: w'312032372035w'H
content portion "1 27 5 6" coding: w'3120323720352036w'H
associated with the block

The value of the attribute "object class" is the complete identifier of the object class description concerned.

The value of the attribute "generator for subordinates" is a sequence of complete identifiers of subordinate object class descriptions.

The value of the attribute "subordinates" consists of a sequence of numbers, each of which indicates a subordinate object at the next lower level of the hierarchy. Each of these numbers is equal to the last number in the object identifier of the

6.6Interchange format

The interchange format class used in this document application profile is **"A"**, as defined in Recommendation T.415.

ANNEX A

(to Recommendation T.501)

Format of the values of the attributes "object identifier", "object class identifier", "object class" and "subordinates"

The object identifiers of the specific layout object descriptions are composed of sequences of numbers, each of these numbers representing a particular level of the specific layout structure.

Attribute	Qual.	Permissible value	Comments
Character presentation attributes	NM

6.5Document profile

The document profile level used in this document application profile is defined in Table 8/T.501. Every document interchanged in accordance with this document application profile must include a document profile. Every non-basic attribute value used in a document must be indicated in the document profile.

Table 6/T.501 defines the allowable values of control function parameters.

TABLE 6/T.501

Control functions applicable to the formatted character content architecture level

Control function with parameters

Control functions	Basic values	Default values	Non-basic values
Identify graphic sub-repertoire (IGS)	0	0	none
Select character spacing (SHS)	0	0	1, 2, 3
Select graphic rendition (SGR)	0, 1, 3, 4, 22, 23, 24	0	26, 50
Select line spacing (SVS)	0, 1, 2, 3	0	4
Code extension	note	none	

Control functions without parameters

* backspace (BS)
* carriage return (CR)
* line feed (LF)
* partial line down (PLD)
* partial line up (PLU)
* space (SP)
* substitute (SUB)

Note - The values are defined by registration numbers and have to be negotiated.

6.4.6Attributes of content portions

Attributes applicable to content portions are defined in Table 7/T.501.

Initial offset	horizontal offset	see definition	none
	= any integer	of the attribute

6.4Content architectures

6.4.1Content architecture levels

Two content architecture levels are defined in this document application profile, namely:

- a formatted character content architecture level;

- a formatted raster graphics content architecture level.

These are defined in the following subsections in accordance with Recommendation T.411.

6.4.2Type of coding for the formatted character content architecture level

The set of graphic elements and the type of coding to be used are defined in Recommenda- tion T.61.

6.4.3Type of coding for the formatted raster graphics content architecture level

The type of coding to be used is as defined in Recommendation T.6. The code extension control function may be used, provided its use is agreed by prior negotiation and is indicated in the document profile. This control function is used to invoke uncompressed mode of coding.

6.4.4Presentation attributes

Table 5/T.501 specifies the allowable presentation attribute values for MM.1.

6.3.3.1Application and classification of attribute for layout component descriptions

The attributes application for MM are defined in Table 1/T.501. The following notation is used in this table:

The form .../... represents:
object class description/object description

where ... is replaced by:
---attribute not applicable to either object class or object description;
-- attribute not applicable;
m mandatory attribute;
nm non-mandatory attribute;
d defaultable attribute.
Capital letters (M, NM and D) are used for groups of attributes.

TABLE 1/T.501

Attributes application and classification

Attribute	Document layout root	Page	Block	
Shared attributes				
Object type	m/m	m/m	m/m	
Object identifier	--/m	--/m	--/m	
Object class identifier	m/--	m/--	m/--

Default value lists	nm/nm	nm/nm	---	
Layout attributes				
Dimensions	---	nm/d	nm/d	
Position	---	nm/d	nm/d	
Layout texture	---	---	---	
Border	---	---	---	
Balance	---	---	---	
Layout path	---	---	---	

6.3.2 The specific layout structure

The number of hierarchical levels allowed is 3, namely:

- document layout root;
- page;
- block.

The three levels are mandatory. If the content portions are not directly associated with each block, then the content portions must be derived from a referenced object class of type block.

by the originator.

6.1.2Specification of constituents

This section specifies the required and optional constituents used for the representation of documents that conform to MM.1. Also, it specifies the content architectures that may be present in these documents.

Constituents specified as "required" must occur in any document that conforms with MM.1. Constituents listed as "optional" may or may not be present in the document depending upon the requirements of the particular document. The document profile indicates which constituents are present in the document.

6.1.2.1Required constituents

- a document profile as specified in § 6.5;

- layout object descriptions representing a specific layout structure as defined in § 6.3.2.

6.1.2.2Optional constituents

- layout object class descriptions representing a "partial" generic layout structure as defined in § 6.3.1.

6.1.3Interchange format class

The interchange format class used in this document application profile is "A", as defined in Recommendation T.415.

6.1.4Object identifiers

The ASN.1 object identifier value to designate the document application profile MM.1 is:

{0020 501 0}

6.2Logical structure

Not applicable.

6.3Layout structure

6.3.1The generic layout structure

The generic layout structure is a "partial" structure and its purpose is to provide for factorization. That is, the "partial" generic layout structure provides for predefined attributes values and content portions for objects in the specific layout structure.

The generic layout structure may contain three types of object classes, namely the document layout root class, the page class and the block class. All are

6.1.1Overview

This section contains the technical specification of the document application profile MM.1. This is in accordance with Recommendation T.411.

This specifies that direction of progression of successive characters along a line of characters.

The basic values are 0^{o} (by default) and 90^{o}.

The negotiable value is 270^{o}.

The mentioned values are measured anti-clockwise.

5.5.2.5Emphasis

This specifies the presentation of the characters. Four modes are available: normal rendition (by default), underlined, italicized and bold.

5.5.2.6First character position

The position of the first character, that may be a space, is defined by cartesian coordinates. 5.5.3Raster graphics content block

5.5.3.1General

The content of blocks of raster graphics is defined by the initial offset (by default, the left top corner) and the dimensions of the array of pixels.

5.5.3.2Pel transmission density

The basic values are:

w

SMU	Pels per 25.4 mm (when the scaling factor is one)
5	240
4	300

The negotiable values are:

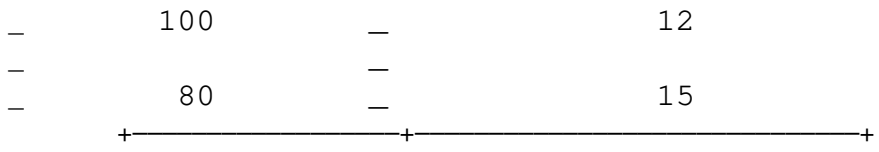
w

SMU	Pels per 25.4 mm (when the scaling factor is one)
6	200
3	400
2	600
1	1200

5.5.4Received document

This document application profile, being limited to formatted form, does not support any features to facilitate processing of an interchanged document by a receiver.

6Specification of the document application profile



100
12
80
15

Within a page, blocks may be positioned in such a way that they intersect partially or fully, i.e. they share common areas.

All blocks are "transparent", that means that the contents of the intersecting areas are combined.

5.4Document layout features

Not applicable.

5.5Content layout and imaging characteristics

5.5.1The mixed mode document may contain blocks with characters in teletex format and blocks with raster graphics in facsimile group 4 format.

The characteristics of the content of a block, such as the line spacing or the character path, are independent of those of other blocks.

All the characteristics cannot be altered anywhere within a block.

5.5.2Character content block

5.5.2.1General

The character content blocks contain graphic characters and control functions.

The control functions define format effectors such as space or carriage return.

5.5.2.2Line spacing

This property specifies the distance between successive lines of text.

The basic values are:

w

SMU	Lines per 25.4 mm (when the scaling factor is one)
200 (by default)	6 (by default)
400	3
300	4
100	12

The negotiable value is 150 SMU which correspond to 8 lines per 25.4 mm when the scaling factor is one.

5.5.2.3Character spacing

This specifies the distance between successive characters on a line of text.

The basic value is 120 SMU which correspond to 10 characters per 25.4 mm when the scaling factor is one.

The negotiable values are:

w

SMU	Characters 25.4 mm (when the scaling factor is one)
200	6

FIGURE 1/T.501

An example of a page

- character content; or
- raster graphics content; or
- both of them.

When different content types are used within the same page, this page must be composed of several blocks.

Each block has a homogeneous content.

5.3.2Page layout characteristics

5.3.2.1The text area

The text area is the area made available for the positioning and display of the document content. The dimensions of the text area must be equal to or smaller than the dimensions of the nominal page corresponding to the paper format used.

The possible paper formats are defined in Recommendation T.561.

Only the vertical orientation of the page is permitted.

5.3.2.2Block

5.3.2.2.1Position and dimension

Each block is positioned in the page and has its own dimensions (independently of the other blocks). Figure 1/T.501 gives an example of a page.

w

+——+

3.3 wFirst application example: THE MIXED MODEw

This is the possibility of mixing various coding types (characters, pels, geometric primitives, etc.) on the same page of a document. The document architecture is thus used to mark out physical areas (blocks) and associates contents with it so as to reproduce the initial image of the page.

The CCITT has, during its last study period, standardized the "mixed mode" application for teletex terminals and group 4 facsimile equipments. This application, described in Recommendation T.72 , only allows at present the mixture of characters and photographic images (facsimile encoded information).

Figure 10 illustrates the mixed mode application in the form of a layout tree with which leaves of different natures are associated. It is as yet too early to know horticulturists' or agronomists' impressions about this surprising property which electronics can now offer!!!

2.1This Recommendation defines a document application profile that is in conformance with the T.410 Series of Recommendations and that allows mixed mode documents to be interchanged only in a formatted form, which allows a recipient to reproduce the document as intended by the originator.

2.2This recommendation defines a document application profile that may be used by any telematic service.

2.3This document application profile is designed to be independent of the means used to create or to interchange the encoded documents.

2.4It is assumed that, when negotiation is performed by the service using this document application profile, all non-basic features are subject to negotiation.

3References

The following references are required in order to implement this Recommendation:

- T.400 Series of Recommendation: "Document architecture, transfer and manipulation".

4Definitions

The definitions in Recommendation T.411 apply to this Recommendation.

5Characteristics supported by this document application profile

5.1Overview

A mixed mode document is the result of a formatting process and therefore the purpose of this document application profile is to allow transfer of the complete layout of the interchanged document.
Furthermore, two categories of content are allowed within the same page, namely:

- a character content as used by word processing machines (e.g. basic teletex equipment);
- a raster graphics content as used by facsimile group 4 apparatus.

This section specifies the functional description of the features supported by this document application profile.

5.2Logical characteristics

Annex A -Format of the values of the attributes "object identifier", "object class identifier", "object class" and "subordinates"

1Scope

1.1This Recommendation defines a document application profile conforming to the T.410 Series of Recommendations.

Its purpose is to specify an interchange format suitable for the interchange of mixed mode documents such as memoranda, letters and reports that contain characters and raster graphics.

Documents are interchanged only in a formatted form which enables the recipient to only display or print the document as intended by the originator.

1.2The features which can be interchanged using this document application profile fall into the following categories:

a) page format features - these concern how the layout of each page of a document will appear when reproduced;

b) character content and raster graphics layout and imaging features - these concern how the document content will appear within pages of the reproduced document;

c) character repertoire - these concern the character sets and control functions that make up the document character content;

d) raster graphics coding - these concern the raster graphics representations and control functions that make up the document raster graphics content.
