

Best Practices in Threat Intelligence

Gather, document, analyse and contextualise intelligence using MISP

Alexandre Dulaunoy

MISP Project

University of Lorraine

MISP
Threat Sharing

- Learn how to use MISP to support common OSINT gathering use-cases often used by SOC, CSIRTs and CERTs
 - ▶ Use practical exercise examples¹
 - ▶ The exercises are based on **practical recent cases to model and structure intelligence** using the MISP standard
- Improve the data models available in MISP by exchanging live improvements and ideas
- Be able to share the results to the community at the end of this session

¹<https://gist.github.com/adulau/8c1de48060e259799d3397b83b0eec4f>

- **Cyber threat intelligence (CTI) is a vast concept** which includes different concepts, methods, and workflows
 - ▶ Intelligence is defined differently in the military than in the financial sector than in the intelligence community
- **MISP project doesn't want to lock an organisation or a user into a specific model.** Each model is useful depending on the objectives of an organisation
- A set of pre-defined knowledge base or data-models are available and organisations can select (or create) what they need
- During this session, an overview of the most used taxonomies, galaxies, and objects will be described

- Quality of indicators/attributes are important but **tagging and classification are also critical to ensure actionable information**
- Organizing intelligence is done in MISP by using tags, which often originate from MISP taxonomy libraries
- The scope can be classification (*tlp, PAP*), type (*osint, type, veris*), state (*workflow*), collaboration (*collaborative-intelligence*), or many other fields
- MISP taxonomy documentation is readily available²
- **Review existing practices of tagging in your sharing community, reuse practices, and improve context**

²<https://www.misp-project.org/taxonomies.html>

- **When information cannot be expressed in triple tags format** (*namespace:predicate=value*), MISP use Galaxies
- **Galaxies** contain a huge set of common libraries³ such as threat actors, malicious tools, tactics, target information, mitigations, and more
- When tagging or adding a Galaxy cluster, tagging at the event level is for the whole event (including attributes and objects). Tagging at the attribute level is for a more specific context

³<https://www.misp-project.org/galaxy.html>

- **Words of Estimative Probability**⁴ propose clear wording while estimating probability of occurrence from an event
- A MISP taxonomy called **estimative-language**⁵ proposes an applied model to tag information in accordance with the concepts of Estimative Probability

RELIABILITY, CREDIBILITY, AND CONFIDENCE

- The **Admiralty Scale**⁶ (also called the **NATO System**) is used to rank the reliability of a source and the credibility of information
- A MISP taxonomy called admiralty-scale⁷ is available
- US DoD **JP 2-0, Joint Intelligence**⁸ includes an appendix to express confidence in analytic judgments
- A MISP predicate in estimative-language called confidence-in-analytic-judgment⁹ is available

- If the information is a **single atomic element**, using a single attribute is preferred
 - ▶ Choosing an attribute type is critical as this defines the automation/export rule (e.g. *url* versus *link* or *ip-src/ip-dst?*)
 - ▶ Enabling the IDS (automation) flag is also important, but *when you are in doubt*, don't set the IDS flag
- If the information is **composite** (ip/port, filename/hash, bank account/BIC), using an object is strongly recommended

HOW TO SELECT THE RIGHT OBJECT?

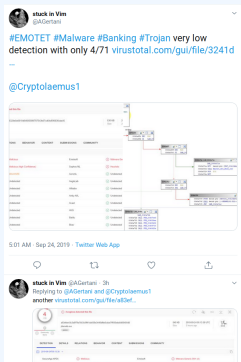

There are more than 150 MISP object¹⁰ templates. As an example, at CIRCL, we regularly use the following object templates *file*, *microblog*, *domain-ip*, *ip-port*, *coin-address*, *virustotal-report*, *paste*, *person*, *ail-leak*, *pe*, *pe-section*, *registry-key*.

¹⁰<https://www.misp-project.org/objects.html>

MICROBLOG OBJECT

Use case

A series of OSINT tweets from a security researcher. To structure the thread, the information, and keep a history.

Object to use

The microblog object can be used for Tweets or any microblog post (e.g. Facebook). The object can be linked using *followed-by* to describe a series of post.

Use case

- A file sample was received by email or extracted from VirusTotal
- A list of file hashes were included in a report
- A hash value was mentioned in a blog post

Object to use

The file object can be used to describe file. It's usual to have partial meta information such as a single hash and a filename.

Add File Object

Object Template	File v17
Description	File object describing a file with meta-information
Requirements	Required one of: filename, size-in-bytes, authenticash, ssdeep, md5, sha1, sha224, sha256, sha384, sha512, sha512/224, sha512/256, tlsh, pattern-in-file, x509-fingerprint-sha1, malware-sample, attachment, path, fullpath
Meta category	File
Distribution	Inherit event
Comment	<input type="text"/>
