

AN INTRODUCTION TO CYBERSECURITY INFORMATION SHARING

MISP - THREAT SHARING

CIRCL / TEAM MISP PROJECT

MISP PROJECT

<https://www.misp-project.org/>

CIRCL - UNI-LORRAINE

MISP
Threat Sharing

AGENDA

- Agenda and details available
<https://www.foo.be/cours/dess-20252026/>

MISP AND STARTING FROM A PRACTICAL USE-CASE

- During a malware analysis workgroup in 2012, we discovered that we worked on the analysis of the same malware.
- We wanted to share information in an easy and automated way **to avoid duplication of work**.
- Christophe Vandeplas (then working at the CERT for the Belgian MoD) showed us his work on a platform that later became MISP.
- A first version of the MISP Platform was used by the MALWG and **the increasing feedback of users** helped us to build an improved platform.
- MISP is now **a community-driven development**.

The Computer Incident Response Center Luxembourg (CIRCL) is a government-driven initiative designed to provide a systematic response facility to computer security threats and incidents. CIRCL is a CERT with national responsibilities for the private sector, communes and non-governmental entities in Luxembourg and is operated by LHC (Luxembourg House of Cybersecurity).

- CIRCL is mandated by the Ministry of Economy and acting as the Luxembourg National CERT for private sector.
- CIRCL leads the development of the Open Source MISP threat intelligence platform which is used by many military or intelligence communities, private companies, financial sector, National CERTs and LEAs globally.
- **CIRCL runs multiple large MISP communities performing active daily threat-intelligence sharing.**

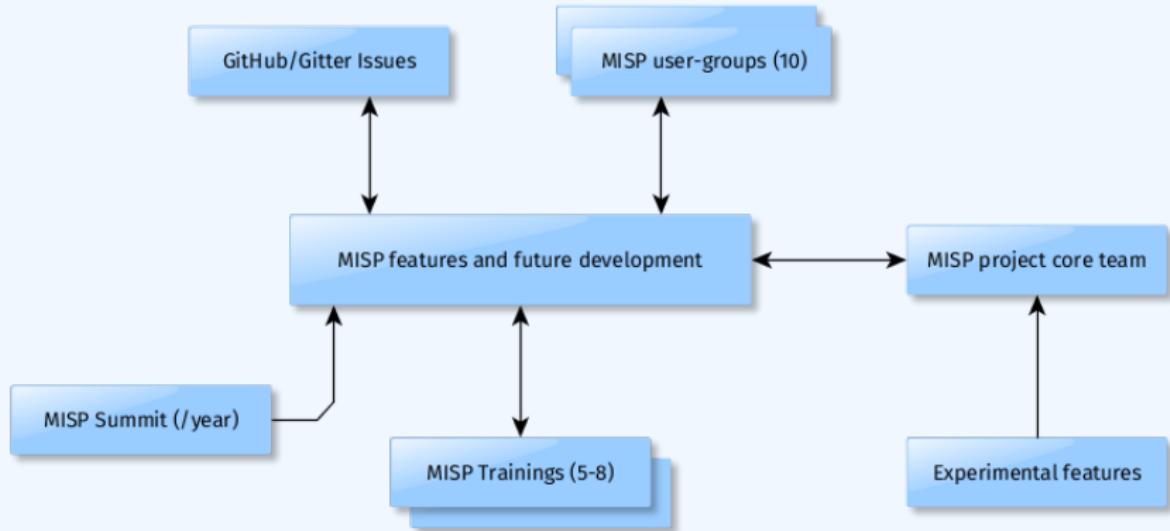

Co-financed by the European Union
Connecting Europe Facility

WHAT IS MISP?

- MISP is a **threat information sharing** platform that is free & open source software
- A tool that **collects** information from partners, your analysts, your tools, feeds
- Normalises, **correlates, enriches** the data
- Allows teams and communities to **collaborate**
- **Feeds** automated protective tools and analyst tools with the output

- There are many different types of users of an information sharing platform like MISP:
 - ▶ **Malware reversers** willing to share indicators of analysis with respective colleagues.
 - ▶ **Security analysts** searching, validating and using indicators in operational security.
 - ▶ **Intelligence analysts** gathering information about specific adversary groups.
 - ▶ **Law-enforcement** relying on indicators to support or bootstrap their DFIR cases.
 - ▶ **Risk analysis teams** willing to know about the new threats, likelihood and occurrences.
 - ▶ **Fraud analysts** willing to share financial indicators to detect financial frauds.

MISP MODEL OF GOVERNANCE

- Sharing indicators for a **detection** matter.
 - ▶ 'Do I have infected systems in my infrastructure or the ones I operate?'
- Sharing indicators to **block**.
 - ▶ 'I use these attributes to block, sinkhole or divert traffic.'
- Sharing indicators to **perform intelligence**.
 - ▶ 'Gathering information about campaigns and attacks. Are they related? Who is targeting me? Who are the adversaries?'
- → These objectives can be conflicting (e.g. False-positives have different impacts)

COMMUNITIES USING MISP

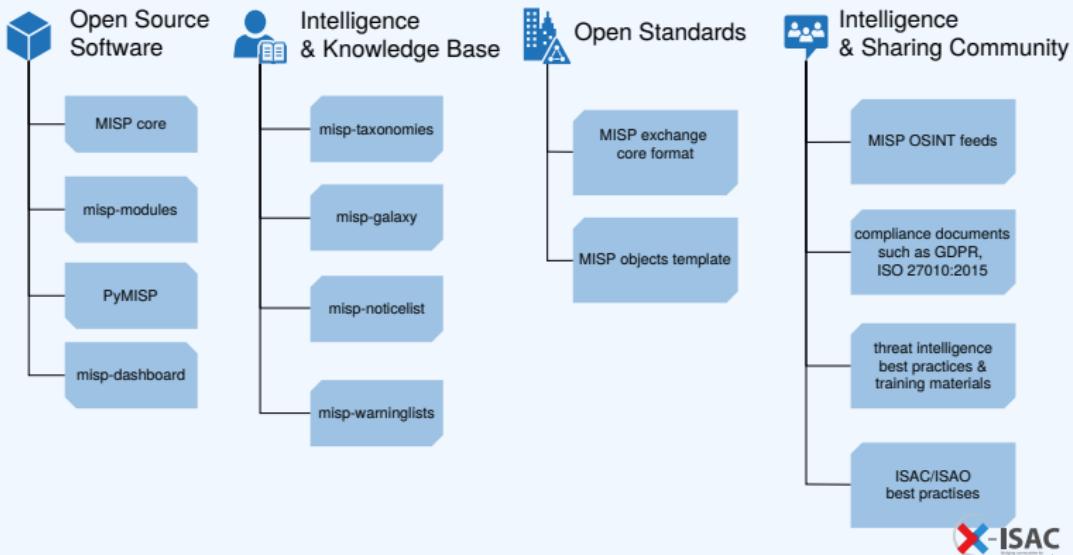

- Communities are groups of users sharing within a set of common objectives/values.
- CIRCL operates multiple MISP instances with a significant user base (more than 1200 organizations with more than 4000 users).
- **Trusted groups** running MISP communities in island mode (air gapped system) or partially connected mode.
- **Financial sector** (banks, ISACs, payment processing organizations) use MISP as a sharing mechanism.
- **Military and international organizations** (NATO, military CSIRTs, n/g CERTs,...).
- **Security vendors** running their own communities (e.g. Fidelis) or interfacing with MISP communities (e.g. OTX).
- **Topical communities** set up to tackle individual specific issues (COVID-19 MISP)

SHARING DIFFICULTIES

- Sharing difficulties are not really technical issues but often it's a matter of **social interactions** (e.g. **trust**).
- Legal restriction¹
 - ▶ "Our legal framework doesn't allow us to share information."
 - ▶ "Risk of information-leak is too high and it's too risky for our organization or partners."
- Practical restriction
 - ▶ "We don't have information to share."
 - ▶ "We don't have time to process or contribute indicators."
 - ▶ "Our model of classification doesn't fit your model."
 - ▶ "Tools for sharing information are tied to a specific format, we use a different one."

MISP PROJECT OVERVIEW

GETTING SOME NAMING CONVENTIONS OUT OF THE WAY...

■ Data layer

- ▶ **Events** are encapsulations for contextually linked information
- ▶ **Attributes** are individual data points, which can be indicators or supporting data
- ▶ **Objects** are custom templated Attribute compositions
- ▶ **Object references** are the relationships between other building blocks
- ▶ **Sightings** are time-specific occurrences of a given data-point detected

■ Context layer

- ▶ **Tags** are labels attached to events/attributes and can come from **Taxonomies**
- ▶ **Galaxy-clusters** are knowledge base items used to label events/attributes and come from **Galaxies**
- ▶ **Cluster relationships** denote pre-defined relationships between clusters

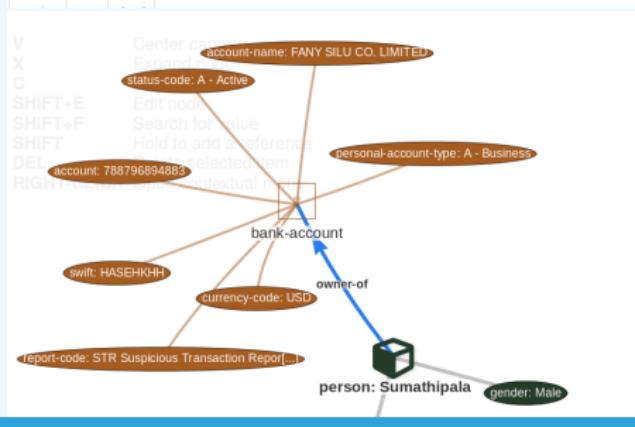

TERMINOLOGY ABOUT INDICATORS

- Indicators²
 - ▶ Indicators contain a pattern that can be used to detect suspicious or malicious cyber activity.
- Attributes in MISP can be network indicators (e.g. IP address), system indicators (e.g. a string in memory) or even bank account details.
 - ▶ **A type (e.g. MD5, url) is how an attribute is described.**
 - ▶ An attribute is always in a category (e.g. Payload delivery) which puts it in a context.
 - **A category is what describes** an attribute.
 - ▶ An IDS flag on an attribute allows to determine if **an attribute can be automatically used for detection.**

²IoC (Indicator of Compromise) is a subset of indicators

Space after Filename	Change Default File	Launch Daemon	Hidden Window	Keychain	System Service Discovery	Third-party Software	Automated Collection	Data Encoding			

SHARING IN MISP

- Sharing via distribution lists - **Sharing groups**
- **Delegation** for pseudo-anonymised information sharing
- **Proposals** and **Extended events** for collaborated information sharing
- Synchronisation, Feed system, air-gapped sharing
- User defined **filtered sharing** for all the above mentioned methods
- Cross-instance information **caching** for quick lookups of large data-sets
- Support for multi-MISP internal enclaves

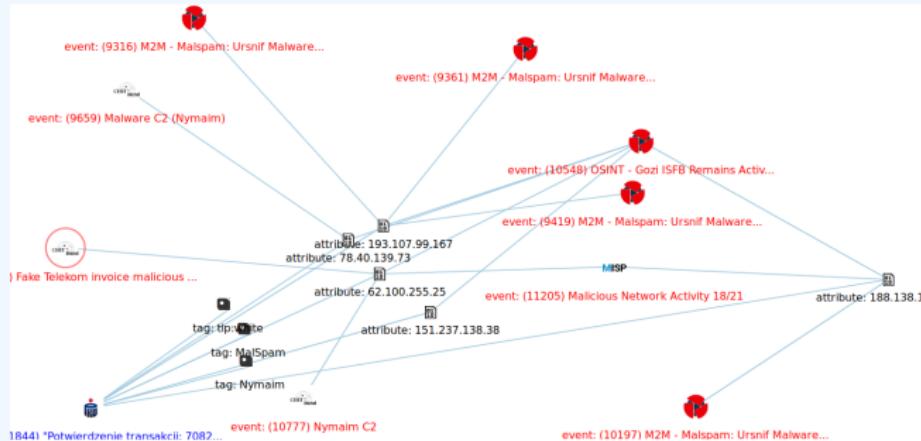

MISP CORE DISTRIBUTED SHARING FUNCTIONALITY

- MISP's core functionality is sharing where everyone can be a consumer and/or a contributor/producer."
- Quick benefit without the obligation to contribute.
- Low barrier access to get acquainted to the system.

- Correlating data
- Feedback loop from detections via **Sightings**
- **False positive management** via the warninglist system
- **Enrichment system** via MISP-modules
- **Integrations** with a plethora of tools and formats
- Flexible **API** and support **libraries** such as PyMISP to ease integration
- **Timelines** and giving information a temporal context
- Full chain for **indicator life-cycle management**

CORRELATION FEATURES: A TOOL FOR ANALYSTS

- To corroborate a finding (e.g. is this the same campaign?), reinforce an analysis (e.g. do other analysts have the same hypothesis?), confirm a specific aspect (e.g. are the sinkhole IP addresses used for one campaign?) or just find if this threat is new or unknown in your community.

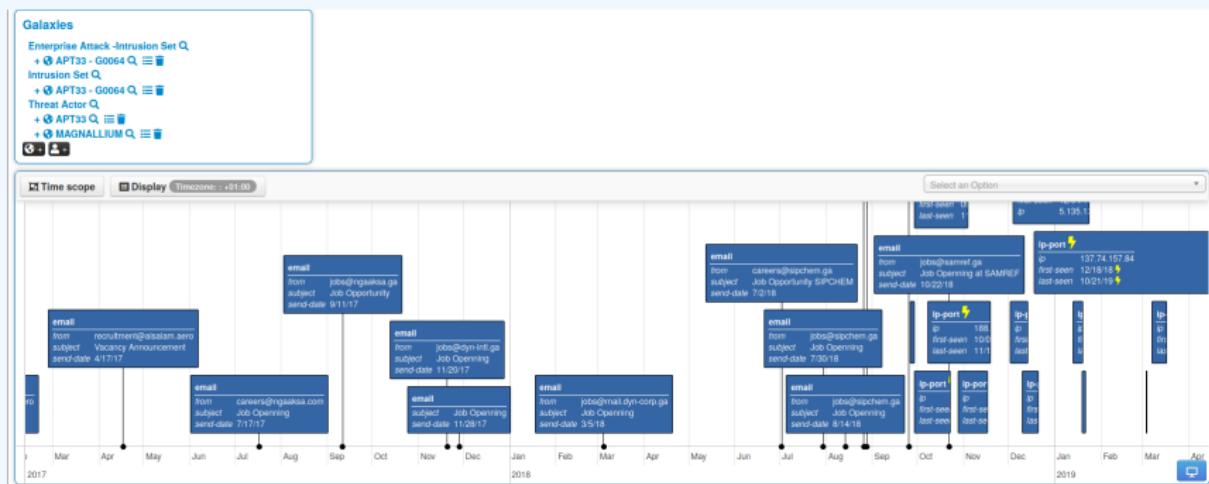

SIGHTINGS SUPPORT

The screenshot shows a user interface for managing sightings. On the left, a list of 'Events' is displayed with three items, each with a checked checkbox and a 'No' label. The first item has a 'Sightings' button. The second item has a 'No' label and a 'No' button. The third item has an 'Inherit' label and a 'No' button. On the right, a detailed view of a sighting is shown. It includes a 'Sightings' section with 'CIRCL: 2 (2017-03-19 16:17:59)' and a 'No' button. Below this is a 'Tags' section with a plus sign icon. Under 'Sighting Details', there is a 'No' button with a red background and a note: '4 (2) - restricted to own organisation only.' At the bottom, there is a 'Discussion' button.

- Has a data-point been **sighted** by me or the community before?
- Additionally, the sighting system supports negative sightings (FP) and expiration sightings.
- Sightings can be performed via the API or the UI.
- Many use-cases for **scoring indicators** based on users sighting.
- For large quantities of data, **SightingDB** by Devo

TIMELINES AND GIVING INFORMATION A TEMPORAL CONTEXT

- Recently introduced **first_seen** and **last_seen** data points
- All data-points can be placed in time
- Enables the **visualisation** and **adjustment** of indicators timeframes

LIFE-CYCLE MANAGEMENT VIA DECAYING OF INDICATORS

The screenshot shows a web-based interface for managing security incidents. At the top, there are navigation links: Pivots, Galaxy, Event graph, Correlation graph, ATTACK matrix, Attributes, and Discussion. Below the navigation is a search bar with the text '48: Decay...'. The main area is titled 'Galaxies' and shows a list of network activity events. Each event row includes a date, type, source IP, tags, and a detailed view section. The detailed view section for each event shows its attributes, a timeline, and associated models with their scores. For example, the first event (2019-09-12) has a score of 65.26 and is associated with 'NIDS Simple Decaying ...' and 'Model 5 | 79.88'. The last event (2019-07-18) has a score of 23.31 and is associated with 'NIDS Simple Decaying ...' and 'Model 5 | 0'. The interface also includes a search bar and a 'Filtering tool' button.

Simulate Attributes with different Models

BOOTSTRAPPING YOUR MISP WITH DATA

- We maintain the default CIRCL OSINT feeds (TLP:WHITE selected from our communities) in MISP to allow users to ease their bootstrapping.
- The format of the OSINT feed is based on standard MISP JSON output pulled from a remote TLS/HTTP server.
- Additional content providers can provide their own MISP feeds. (<https://botvrij.eu/>)
- Allows users to **test their MISP installations and synchronisation with a real dataset.**
- Opening contribution to other threat intel feeds but also allowing the analysis of overlapping data³.

³A recurring challenge in information sharing

CONCLUSION

- **Information sharing practices come from usage** and by example (e.g. learning by imitation from the shared information).
- MISP is just a tool. What matters is your sharing practices. The tool should be as transparent as possible to support you.
- Enable users to customize MISP to meet their community's use-cases.
- MISP project combines open source software, open standards, best practices and communities to make information sharing a reality.
