#### Promiscuous mode

Where can we capture the network data ? a layered approach

- A network card can work in two modes, in non-promiscuous mode or in promiscuous mode :
  - In non-promiscuous mode, the network card only accept the frame targeted with is own MAC or broadcasted.
  - In promiscuous mode, the network card accept all the frame from the wire. This permits to capture every packets.

ifconfig eth0 promisc

• Other approaches possible to capture data (Bridge interception, dup-to of a packet filtering, ...)

A side note regarding wireless network, promiscuous mode is only capturing packet for the associated AP. You'll need the monitor mode, to get capturing everything without being associated to an AP or in ad-hoc mode.

# **BPF** History

How to get the data from the data link layers ?

- BPF (Berkeley Packet Filter) sits between link-level driver and the user space. BPF is protocol independant and use a filter-before-buffering approach. (NIT on SunOS is using the opposite approach).
- BPF includes a machine abstraction to make the filtering (quite) efficient.
- BPF was part of the BSD4.4 but libpcap provide a portable BPF for various operating systems.
- The main application using libpcap (BPF) is tcpdump. Alternative exists to libpcap from wiretap library or Fairly Fast Packet Filter.

Network data capture is a key component of a honeynet design.

Libpcap-based Digging in a real capture Q and A Flomacuous Indue BPF BPF - Filter Syntax 2 BPF - Filter Syntax 3 BPF - Filter Syntax 4 BPF - Filter Syntax 5 BPF - Filter Syntax 5 BPF - Filter Syntax 6 BPF - Filter Syntax 7 Libpcap - a very quick introduction 2//

# **BPF** - Filter Syntax

• How to filter specific host :

host myhostname dst host myhostname src host myhostname

• How to filter specific ports :

port 111 dst port 111 src port 111

Libpcap-based Digging in a real capture Q and A Promiscuous mode BPF BPF - Filter Syntax BPF - Filter Syntax 3 BPF - Filter Syntax 4 BPF - Filter Syntax 5 BPF - Filter Syntax 5 BPF - Filter Syntax 7 Libpcap - a very quick introduction 2/3

## **BPF** - Filter Syntax

- How to filter specific net :
  - net 192.168 dst net 192.168 src host 192.168
- How to filter protocols : ip proto \tcp ether proto \ip

Libpcap-based Digging in a real capture Q and A Flomscuous mode BPF BPF - Filter Syntax 2 BPF - Filter Syntax 3 BPF - Filter Syntax 4 BPF - Filter Syntax 5 BPF - Filter Syntax 5 BPF - Filter Syntax 6 BPF - Filter Syntax 7 Libpcap - a very quick introduction 2/2

# **BPF** - Filter Syntax

- Combining expression :
  - && -> concatenation
  - not -> negation
  - || -> alternation (or)
- Offset notation :

Libpcap-based Digging in a real capture Q and A Promiscuous mode BPF BPF - Filter Syntax BPF - Filter Syntax 3 BPF - Filter Syntax 3 BPF - Filter Syntax 5 BPF - Filter Syntax 5 BPF - Filter Syntax 6 BPF - Filter Syntax 7 Libpcap - a very quick introduction 2/2

#### **BPF** - Filter Syntax

- Offset notation and matching notation (what's the diff?): ip[22:2]=80 tcp[2:2]=80 ip[22:2]=0x80
  - tcp[2:2]=0x80

Promiscuous mode BPF BPF - Filter Syntax BPF - Filter Syntax 2 BPF - Filter Syntax 3 BPF - Filter Syntax 4 BPF - Filter Syntax 5 BPF - Filter Syntax 5 BPF - Filter Syntax 7 Libpcap - a very quick introduction 2/3

#### **BPF** - Filter Syntax

• Using masks to access "bits" expressed information like TCP flags:

tcp[13] &9 = 1 tcp[13] &1 = 1 tcp[13] &41 = 41

Promiscuous mode BPF BPF - Filter Syntax BPF - Filter Syntax 2 BPF - Filter Syntax 3 BPF - Filter Syntax 5 BPF - Filter Syntax 5 BPF - Filter Syntax 6 BPF - Filter Syntax 7 Libpcap - a very quick introduction 2/2

# **BPF** - Filter Syntax

- If you don't want to match every bits, you have some variations.
- Matching only some bits that are set :

tcp[12] &9 != 0

 If you want to match the exact value without the mask : tcp[12] = 1

Promiscuous mode BPF BPF - Filter Syntax BPF - Filter Syntax 3 BPF - Filter Syntax 3 BPF - Filter Syntax 5 BPF - Filter Syntax 5 BPF - Filter Syntax 7 Libpcap - a very quick introduction Libpcap - a very quick introduction 2/:

#### BPF - Filter Syntax

Using masks to access "bits" expressed information like IP version:

ip[0] & 0xf0 = 96

Promiscuous mode BPF BPF - Filter Syntax BPF - Filter Syntax 2 BPF - Filter Syntax 3 BPF - Filter Syntax 4 BPF - Filter Syntax 5 BPF - Filter Syntax 5 BPF - Filter Syntax 7 Libpcap - a very quick introduction 2/

## BPF - Filter Syntax on Payload

- Matching content with a bpf filter. bpf matching is only possible on 1,2 or 4 bytes. If you want to match larger segment, you'll need to combine filter with &&.
- An example, you want to match "GE" string in a TCP payload : echo -n "GE" | hexdump -C 00000000 47 45 |GE| sudo tcpdump -s0 -n -i ath0 "tcp[20:2] = 0x4745"

Promiscuous mode BPF BPF - Filter Syntax BPF - Filter Syntax 2 BPF - Filter Syntax 3 BPF - Filter Syntax 4 BPF - Filter Syntax 5 BPF - Filter Syntax 5 BPF - Filter Syntax 7 Libpcap - a very quick introduction 2/

#### Libpcap - a very quick introduction

• How to open the link-layer device to get packet :

• How to use the BPF filtering :

Promiscuous mode BPF BPF - Filter Syntax 2 BPF - Filter Syntax 3 BPF - Filter Syntax 4 BPF - Filter Syntax 5 BPF - Filter Syntax 5 BPF - Filter Syntax 6 BPF - Filter Syntax 7 Libpcap - a very quick introduction 2/2

# Libpcap - a very quick introduction 2/2

• How to capture some packets :

u\_char \*pcap\_next(pcap\_t \*p, struct pcap\_pkthdr \*h)

• How to read the result (simplified) from the inlined structs :

Libpcap libraries Libpcap tools

# Libpcap libraries

You don't like C and want to code fast for the workshop... Here is a non-exhaustive list of libcap (and related) binding for other languages :

- Net::Pcap Perl binding
- pcap ruby Ruby binding with a nice OO interface
- pylibpcap Python binding
- MLpcap ocaml binding ;-)

• ...

Libpcap libraries Libpcap tools

# Libpcap tools

- tcpdump, tcpslice
- ngrep (you can pass regex search instead of offset search)
- Ethereal/tEthereal (now called Wireshark)
- tcpdstat
- tcptrace
- ipsumdump

# Digging in a real capture

The common capture that will be used in this workshop : SHA1 - 9e2107c7d481a1a694b2c8692b99de0022ef40cd capture.cap more than 500 MB of Data...

- Where to start ? Focus on little events ? big events ?
- How to cut the capture ? Slicing by date ? by size ?
- You can use any of the tools proposed but ...
- ... you can build your own tools to ease your work.
- Time reference is a critical part in forensic analysis.
- Be imaginative.

- Thanks for listening.
